

Vortex flow sensor VA Di Ex-d with integrated, configurable transducer UVA in a flameproof enclosure for applications in explosive atmospheres

VA Di ... ZG1 Ex-d

Measured variables

- actual flow rate
- actual velocity
- standard volume flow (in combination with pressure and temperature sensors)

Design

- measuring tube with flanged connection

Kármán vortex street

Functional principle

- vortex meter for measuring flow rate and volume
- ultrasonic acquisition of the frequency of the vortex shedding

Advantages

- compact unit for explosive atmospheres with local display
- applications in Category 1 (Zone 0 and 20); transducer housing approved for Category 2 (Zone 1 and 21)
- no external isolation/supply unit necessary
- recognizes even the lowest rates of flow, thanks to patented ultrasonic sensing
- high turndown (up to 1 : 100)
- no moving parts
- easy to clean
- high durability
- corrosion-resistant
- largely unaffected by gas composition
- marginal pressure loss
- easy adjustment of parameters with HART® interface

Examples of application

- flow measurement in explosive atmospheres: air, exhaust air, sludge activation air, engine intake air, natural gas, waste gas, process gas, biogas, car exhaust emissions, flare gas, water vapour, ...

Media

- primarily single-phase gas mixtures with air, nitrogen, oxygen, methane, natural gas, flare gas, ammonia, argon, carbon monoxide, water vapour, ... as dominant components; combustion gas, biogas, fermentation gas, sewer gas

Other gases and gas mixtures on request.

Particles, humidity and condensation

- dust or fibre particles in the gas do not affect the measurement, as long as these are not abrasive or accumulate on the sensor
- measurement uncertainty remains unaffected by a relative gas humidity of less than 100 % and a slight accumulation of condensate on the sensor

Installation position

any	to ensure that sensors remain operative in horizontal pipelines, even with slight accumulation of condensate, VA Di 25 sensors should be installed with the connection housing facing upwards, and VA Di 40, 50, 80 and 100 sensors with the connection housing facing sideways. In the case of vertical pipelines positioning of all VA Di sensors - even with slight accumulation of condensate - can be chosen freely.
